Agenda

1) Hey Chicago – What Do You Say? How' bout them Cubbies?
   a) A follow up from our October 2012 meeting, Best Ideas portfolio
   b) A follow up from our November 2014 meeting, Dividend Growth portfolio

2) The Importance of FSA -- The Kinder Morgan Call
   a) Discrepancies in the Financial Statements
   b) Considering the Magnitude of Key Sensitivities
   c) Assessing Credit Quality in Reported Fashion
   d) Determining Valuation in the Correct Context

3) Understanding the Great Pipeline Cash Shortfall
   a) Overleveraged and Insufficient Free Cash Flow
   b) MLPs Are Systematically Mispriced But Will They Always Be?
   c) We're Now Neutral on the Midstream Energy Space
   d) Our call has largely "played out"

4) Thoughts on Uncovering the Next "Big Fall"
   a) The Valuentum Buying Index Rating System (list of 1s)
   b) Risks of Dividend Growth Investing
   c) Consumer Staples – what are the risks?

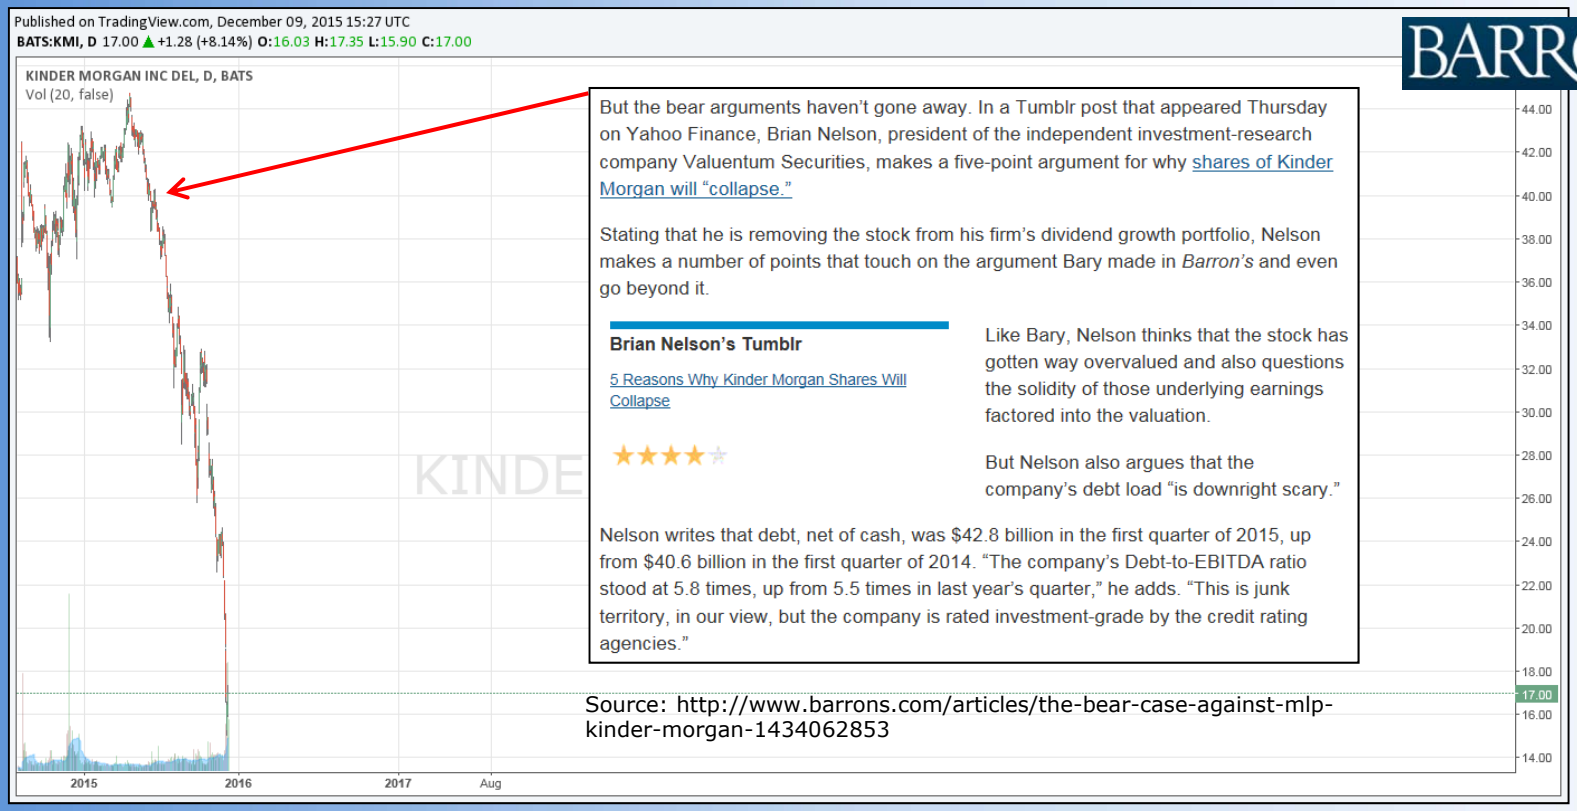
"The Bear Case Against Kinder Morgan" – Barron's, Jun 11 2015

"5 Reasons Why We Think Kinder Morgan's Shares Will Collapse," by Valuentum

(1)



BARRON'S

But the bear arguments haven't gone away. In a Tumblr post that appeared Thursday on Yahoo Finance, Brian Nelson, president of the independent investment-research company Valuentum Securities, makes a five-point argument for why shares of Kinder Morgan will "collapse."

Stating that he is removing the stock from his firm's dividend growth portfolio, Nelson makes a number of points that touch on the argument Bary made in *Barron's* and even go beyond it.

Brian Nelson's Tumblr

5 Reasons Why Kinder Morgan Shares Will Collapse

★★★★☆

Like Bary, Nelson thinks that the stock has gotten way overvalued and also questions the solidity of those underlying earnings factored into the valuation.

But Nelson also argues that the company's debt load "is downright scary."

Nelson writes that debt, net of cash, was $42.8 billion in the first quarter of 2015, up from $40.6 billion in the first quarter of 2014. "The company's Debt-to-EBITDA ratio stood at 5.8 times, up from 5.5 times in last year's quarter," he adds. "This is junk territory, in our view, but the company is rated investment-grade by the credit rating agencies."

VALUENTUM

The “10 Reasons” of the KMI Call – released June 2015

1) The valuation paradigm has changed.
2) Kinder Morgan's dividend growth endeavors will disappoint.
3) The company's net debt load is $40+ billion.
4) The company is trading at 40+ forward earnings.
5) The natural reaction from shareholders will be skepticism and disbelief.
6) Kinder Morgan's dividend is in part organic, in part financially-engineered.
7) The traditional "blind" use of the dividend discount model does not apply to Kinder Morgan.
8) The company's implied leverage is 19 times after considering all cash, debt-like commitments, at least in the eyes of shareholders.
9) Bondholders will start to care. Equity holders will start to care. They will - and then it all unravels.
10) Highly-publicized insider purchases are not a sign of support, in the case of Kinder Morgan, but an admission of vulnerability.

From: *"5 More Reasons Why We Think Kinder Morgan's Shares Will Collapse"*

"A fresh, unbiased voice is saying: 'Your stock is trading at ~100 times the trailing 3-year average of free cash flow, ~40+ times forward earnings, the company has implied leverage of 19 times after considering all of your cash, debt-like commitments, and it has negligible cash on the books. Yet 'everybody' loves both your equity and your debt?' Clearly, something is wrong."

VALUENTUM

Your Rich Uncle and Your Poor Cousin

The Dividend Cushion Ratio Helps Income Investors

$$\frac{\sum_{t=1}^{5}[A(t) - B(t)] + C(0) - D(0)}{\sum_{t=1}^{5} E(t)}$$

A = cash flow from operations (from the operating section of the cash flow statement),
B = capital expenditures or additions to property plant and equipment (from the investing section of the cash flow statement),
C = cash and cash equivalents (from the balance sheet),
D = long-term debt (from the balance sheet), and
E = cash dividends paid (from the financing section of the cash flow statement).

"All else equal, a firm with billions of net cash on the balance sheet is better positioned to keep paying a dividend than a firm with billions of net debt on the balance sheet. More cash on the books relative to debt reveals significantly more financial flexibility. The dividend payout ratio ignores this important concept, while the Dividend Cushion ratio embraces it." – Valuentum's Brian Nelson, CFA

VALUENTUM

Considering Key Sensitivities

1) Meaningful Commodity Price Exposure…
   → Changes in operating income are more severe
2) Hedges Are Rolling Off…
   → Exposure getting worse
3) Material Interest Rate Risk!
   → Contractionary monetary policy?!?!

$1/Bbl change in oil price = $10 million DCF impact; 10¢/MMBtu change in natural gas price = $3 million DCF impact

Source: KMI

CO_2

- 33% CO_2 transport and sales
- 67% oil production-related
  - Production hedged:

	Hedged[b]	Avg. Px.
2015	88%	$78
2016	79%	$72
2017	58%	$73
2018	45%	$75
2019	24%	$66

Our large amount of variable rate debt makes us vulnerable to increases in interest rates.

As of December 31, 2014, approximately $11 billion of our approximately $41 billion of consolidated debt (excluding debt fair value adjustments) was subject to variable interest rates, either as short-term or long-term debt of variable rate debt obligations, or as long-term fixed-rate debt effectively converted to variable rates through the use of interest rate swaps.

The Cost of Capital

- **New long-term hurdle rate for accretion = ~4% after-tax**
  - Analyst Day Hurdle Rate: 50% equity[a] x 4.1% yield[b]
    + 50% debt[a] x 2.4%[c] cost of debt
    = 3.3% hurdle rate

Source: KMI

Management Guidance

"In our discounted cash-flow models that we use to value every non-financial operating company in our coverage universe, we match the duration of future free cash flows (from year 1 to perpetuity) with expectations of the average discount rate over this forecast horizon (from year 1 to perpetuity). We think the best way to achieve expectations of the long-term future average rate of the 10-year Treasury (risk free rate) is to use the weighted average of the historical 10-year Treasury and the current spot rate. The goal of using a weighted average risk free rate in our DCF process is to achieve balance with respect to the duration of future cash flows. For example, discounting a cash flow in Year 20 at the current spot rate doesn't make much sense to us. Other methods consider the yield curve in discounting future free cash flows, or use a long-term average of the risk free rate without considering near-term changes in the 10-year Treasury rate. We think the use of the spot rate on the 10-year Treasury as the risk free rate in any valuation model would not only cause significant fair-value volatility but also result in a systematic overvaluation of companies relative to their true long-term intrinsic worth. "

LT Avg. Risk free rate + Spread Over 10-year = ~8%-10% weighted average cost of capital

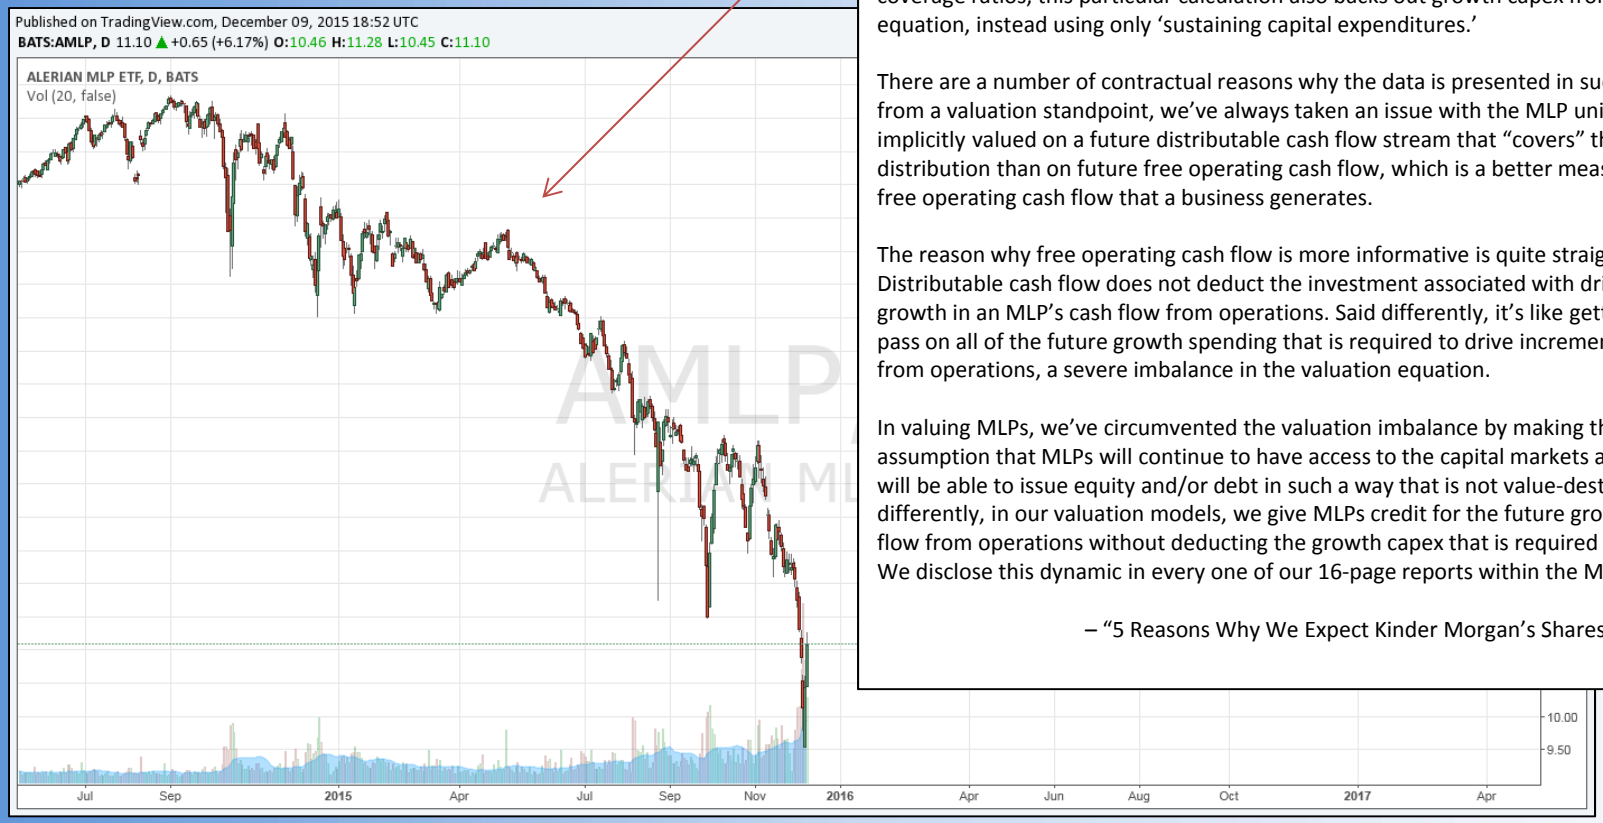
2015 Marked The Midstream MLP "Fallout"



"Most, if not all, MLPs report distributable cash flow (DCF), which does not in the calculation consider growth capex, an important driver behind the generation of increased cash flow from operations in the future. When MLPs report distribution coverage ratios, this particular calculation also backs out growth capex from the equation, instead using only 'sustaining capital expenditures.'

There are a number of contractual reasons why the data is presented in such a way, but from a valuation standpoint, we've always taken an issue with the MLP universe being implicitly valued on a future distributable cash flow stream that "covers" the distribution than on future free operating cash flow, which is a better measure of the free operating cash flow that a business generates.

The reason why free operating cash flow is more informative is quite straightforward. Distributable cash flow does not deduct the investment associated with driving future growth in an MLP's cash flow from operations. Said differently, it's like getting a free pass on all of the future growth spending that is required to drive incremental cash flow from operations, a severe imbalance in the valuation equation.

In valuing MLPs, we've circumvented the valuation imbalance by making the universal assumption that MLPs will continue to have access to the capital markets and that they will be able to issue equity and/or debt in such a way that is not value-destructive. Said differently, in our valuation models, we give MLPs credit for the future growth in cash flow from operations without deducting the growth capex that is required to drive it. We disclose this dynamic in every one of our 16-page reports within the MLP space."

VALUENTUM

Systematically Mispriced

"In the illustrative example that follows which includes both growth capital spending and a marginal cost of capital of 10%, holders of MLPs will have to wait years before the intrinsic value of the security catches up to the present market price (comparison shown in orange). Said differently, units in this example are significantly overpriced in today's market.

Current Market Price of Security				15,500	Takeaway: MLPs are significantly overpriced today.											

Notes

1) The intrinsic value calculation uses a conservative 10% hurdle rate for new projects. In the context of the long-term average yield on the 10-year Treasury note, 1962-2014 of ~6.5% and the implied equity risk premium on Oct. 1, 2015 = 6.63%, source: Damodaron, this can be considered a conservative measure over the long haul.

2) The present value of future free cash flows to the firm (FCFF) is increased annually by the discount rate, which assumes cash accumulated is invested at a 10% compound annual return, a very generous assumption.

3) Since the publishing of the latest edition of this slide, the long-term growth rate of this illustration was lowered to 2% from 3% to better account for a growth rate, in the absent of expansion capex, utility commissions may allow. The framework assumes annual pricing increases of 2% into perpetuity.

4) The analysis assumes no pipelines will ever have to be completely replace/overhauled, but only maintained into perpetuity, arguably the most generous assumption. If an MLP has to completely replace a pipeline with new 'growth' capex, the economics of the business model breaks down.

We’re Now Neutral on the MLP Universe

1) We pounded the table on the hazards of the energy midstream space in mid-2015 prior to the collapse in unit prices.
2) More than 20 energy midstream MLPs alone have slashed their distributions since that time.
3) Kinder Morgan, the implicit cut at Energy Transfer Equity and Plains All American were the highest profile.
4) We continue to be very cautious on these business models in light of their capital-market dependency, but we’re now neutral on the space.
5) Kinder Morgan is now a holding in the Best Ideas Newsletter portfolio.

"Is Kinder Morgan on Road to Recovery?" – Barron's, Jan 21 2016

"Time to Load Up on Kinder Morgan,"
By Valuentum

But if one stock symbolizes the good news, it's probably beleaguered midstream energy company Kinder Morgan (ticker: KMI), which finished up 15.5% Thursday after a better-than-expected earnings report.

Even Brian Nelson, an investor advisor who generated scorn from Kinder fans for turning bearish on the stock in a much-discussed June 11 Tumblr post, penned a piece Thursday that is quite positive.

Brian Nelson's Tumblr

Time to Load Up on Kinder?

"We're starting to like what we're hearing from management, and we again applaud the executive team because we think they understand the issues and are working toward a solution," he writes. "On the conference call, the team made it very clear to investors that the dividend is not a driver behind the intrinsic valuation of equities, but that it is an output of the free cash flow generating capacity of the entity, or at least it should be."

Valuentum Proprietary Data for MLPs

1) Fair Value Estimates

   Note: For MLPs, we do not deduct growth capital in the valuation equation. We believe our fair value estimates would be substantially lower in the event that we did. The low end of the fair value range is a better approximate for most MLPs, in our view.

2) Dividend Cushion Ratios

   Note: For MLPs, we provide a raw, unadjusted Dividend Cushion ratio and an adjusted Dividend Cushion ratio. The unadjusted ratio should be relied upon in periods of capital-market uncertainty.

Thoughts on the Next "Big Fall"

"The market can remain irrational longer than you can remain solvent."

– John Maynard Keynes

1) We're not advocates of naked "short selling."
2) The Kinder Morgan call was rather unique – focused on extensive equity and credit analysis, not on "finding fire."
3) For ideas that we think are poised to decline materially in coming years, the Valuentum Buying Index can be used as an idea generator.
4) For example, Kinder Morgan registered a 1, the lowest rating on the VBI, just before shares collapsed.

Important Risks for Dividend Growth Investors

- Beware of financially-engineered dividends as in the case of MLPs and some REITs.
- Too many definitions of cash flow – focus on traditional free cash flow (cash flow from operations less *all* capital spending)
- If the dividend yield is too good to be true, it probably is… (8%+ = danger!). Use common sense.
- Rising interest rates could complicate the strategy. Higher rates could cause permanent capital impairment in income-oriented equity holdings, especially ones with financially-engineered payouts.
- Don't fall in love with the past – the future is all that matters. A dividend track record is history.
- The current state of the global economy.
